[Bluetooth Blood Glucose Meter Now Interoperable With Nokia Phones](#)

Filed under: [Medicine](#) , [Net News](#) , [Pediatrics](#)

Nokia has partnered with **Entra Health Systems** to allow linking of a Bluetooth wireless enabled glucose meter with more than 50 models of mobile phones. Customers of Nokia can now download the app from the [Ovi Store](#) and keep track of their readings on mobile phones. Seems like it's time to get rid of that redundant screen on the blood glucose meter and make it into a purely test and transmit device.

Features of the MyGlucoHealth Diabetes app on Nokia:

- Wirelessly upload blood tests to the MyGlucoHealth Portal.
- Review and evaluate results on their handset, as well as chart data or enter weight, exercise and nutritional information.
- Notify family, physicians or caregivers with automated text message alerts and reminders when results exceed personally established threshold limits.
- Send and receive secure messages from their physician.
- Order replacement test strips for their MyGlucoHealth meter.
